

## Installation Help !

### Pre-installation steps

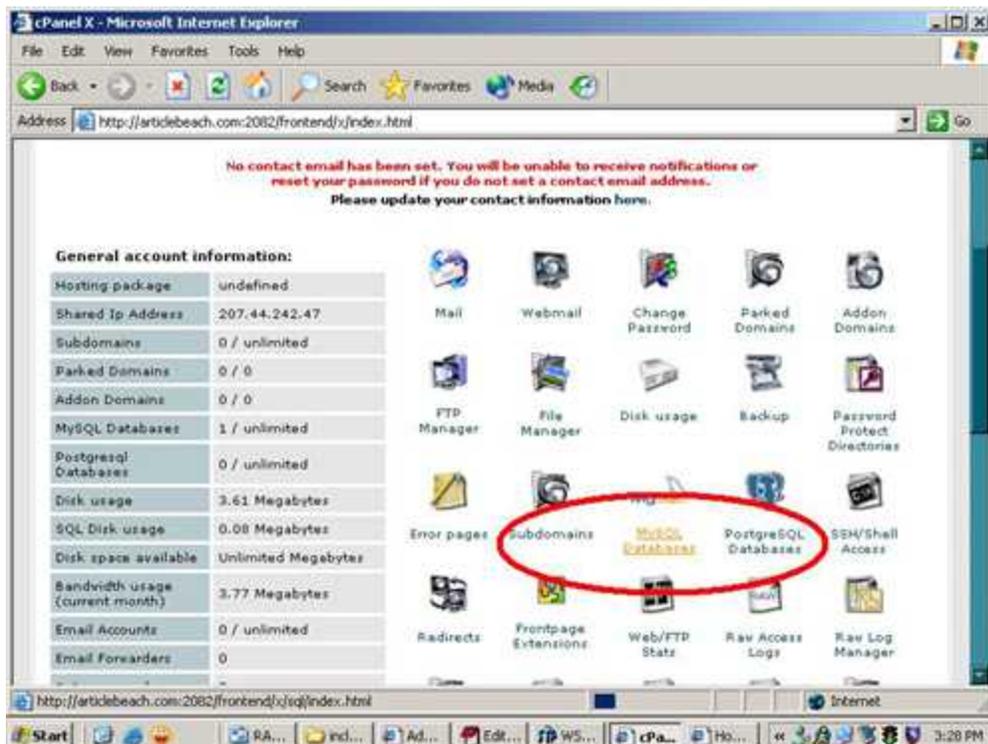

Before running *setup.exe* file you'll need to create (or use existing) MySQL database and add user to database (or use existing). There are 3 steps, these steps are the same for all platforms and Control Panels:

- creating database and adding user to this database.
- Information about database host, database name, database user and database password will be needed to configure connection to your database during setup.(Configuration Tool).
- Run SQL Query Window and upload .sql file from Database(db) folder

Below is an example of these steps on Linux standard hosting and CPanel.

### Prepare Your Database

Open MySQL Using cPanel start by clicking the MySQL Databases Icon..

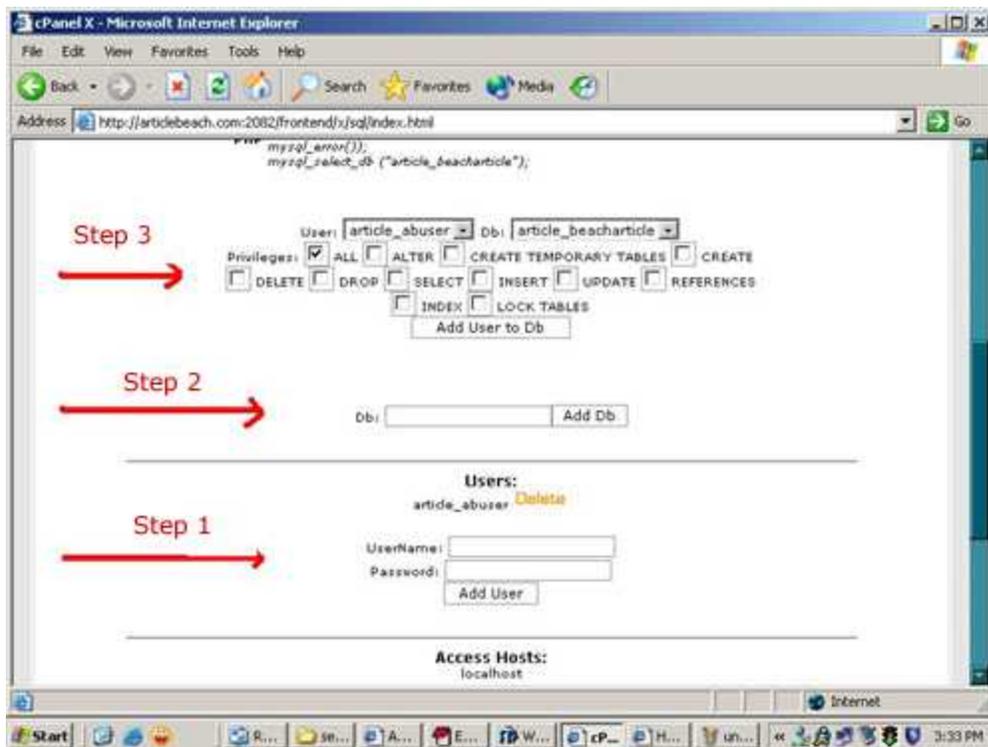

Once Inside

Create an empty MySQL database on your server use any name you wish

Create a username and password.

Assign this user to database you created

## Populate Your Database

Go to Phpmyadmin at the bottom of your database menu above and select your database from left side menu. Then click SQL to open a SQL Box

---

User:  Db:

Privileges:  ALL  ALTER  CREATE TEMPORARY TABLES   
CREATE  DELETE  DROP  SELECT  INSERT  UPDATE   
REFERENCES  INDEX  LOCK TABLES

Db:

---

**Users:**  
articleb\_jer [Delete](#)

UserName:   
Password:

---

**Access Hosts:**  
localhost

Host (% wildcard is allowed):

---

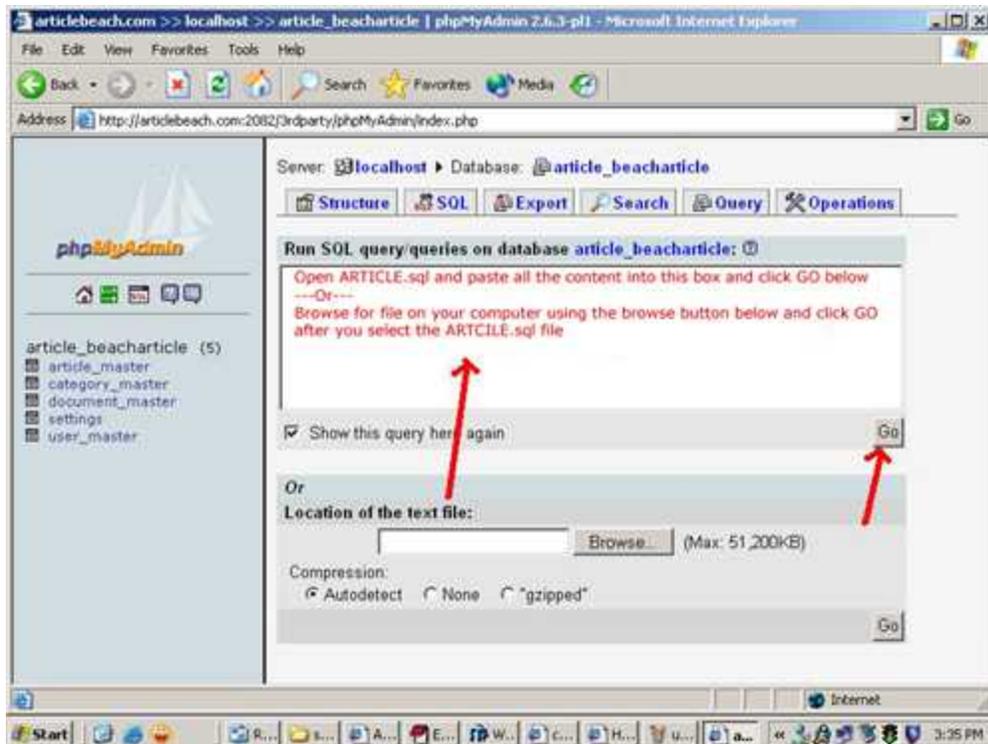

[phpMyAdmin](#) 

You can use phpMyAdmin to administrate your MySQL databases in a web based environment.

---

Open the `***.sql` which is located in the Database(db) folder into a text editor (such as notepad or editPlus)

Copy and paste all of its content into the SQL box OR you may also upload this database via the upload function.

Now your database is fully created and ready to use with default categories and the admin login.

## Final Step

Then you can run *setup.exe* file.

Installation process is very simple now- you need only your FTP information if you install script to remote site.

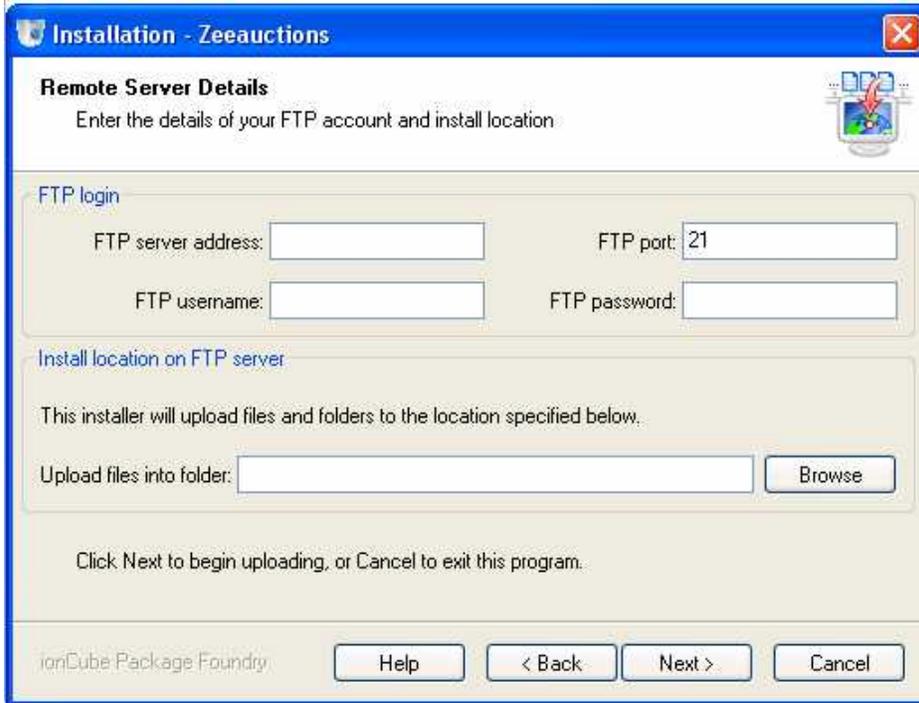

If you want to install script on local machine installation process is similar, only Web Server like Apache, MySQL and PHP must be installed on your PC.

1. Please read and accept license agreement

2. Enter you FTP info.

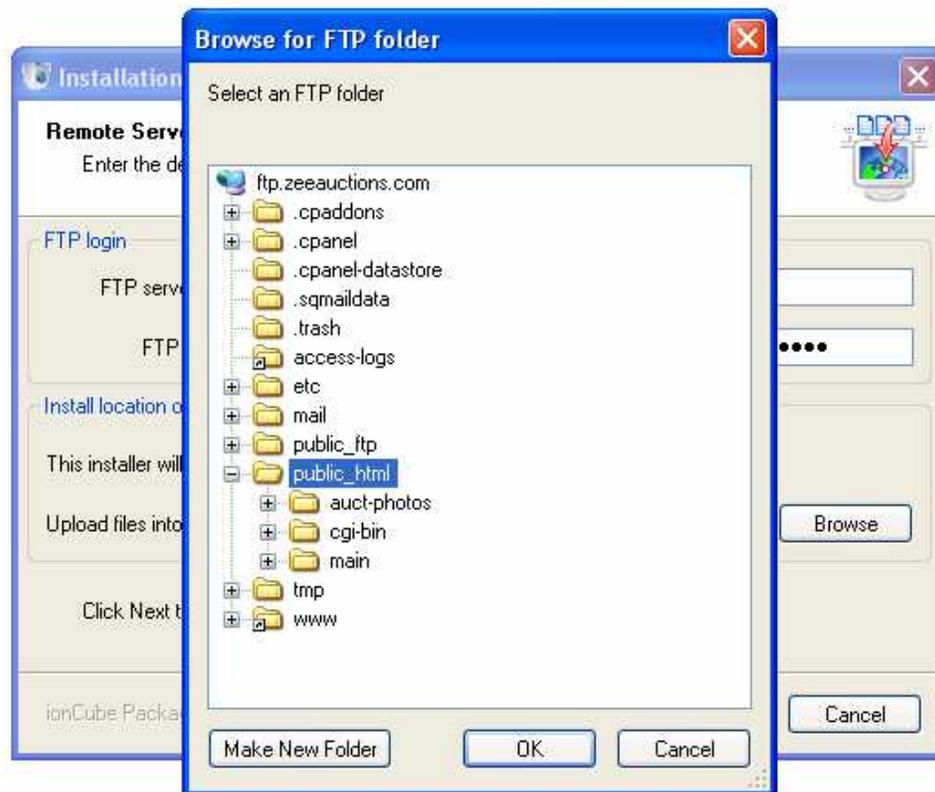

e.g. ftp.yoursite.com

login and password

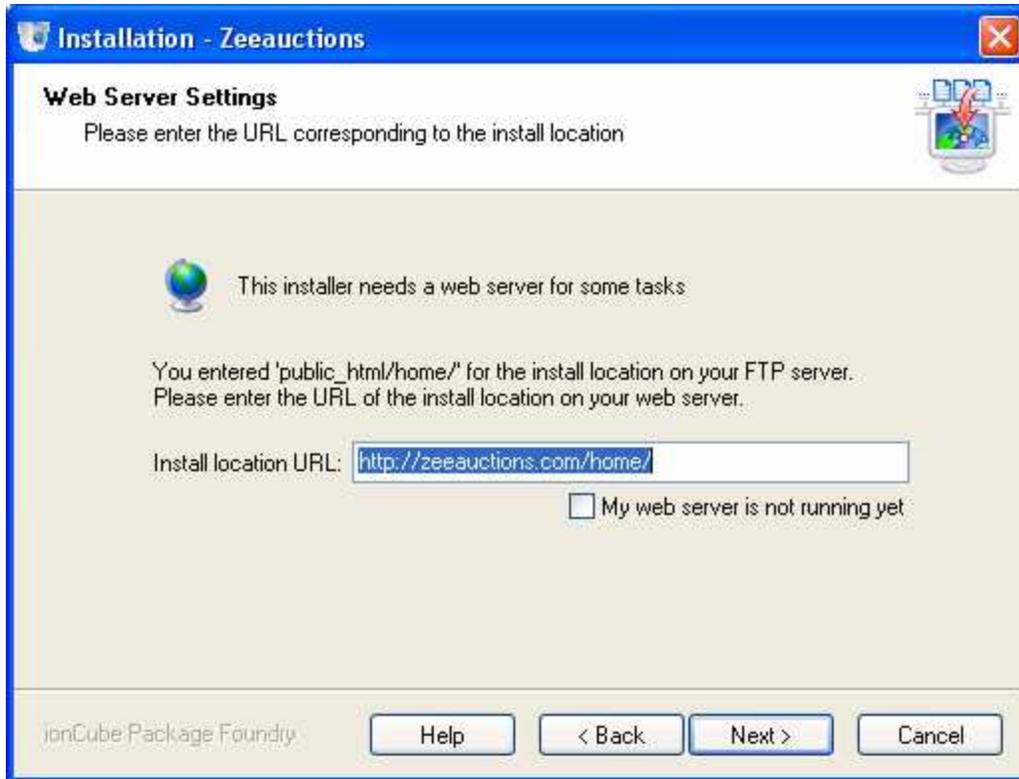

3. Select installation folder on your site.

You'll need to upload files to public document folder of your site, it usually called *'public\_html'*, or *'www'* or *'htdocs'* depending of operating system of your server.

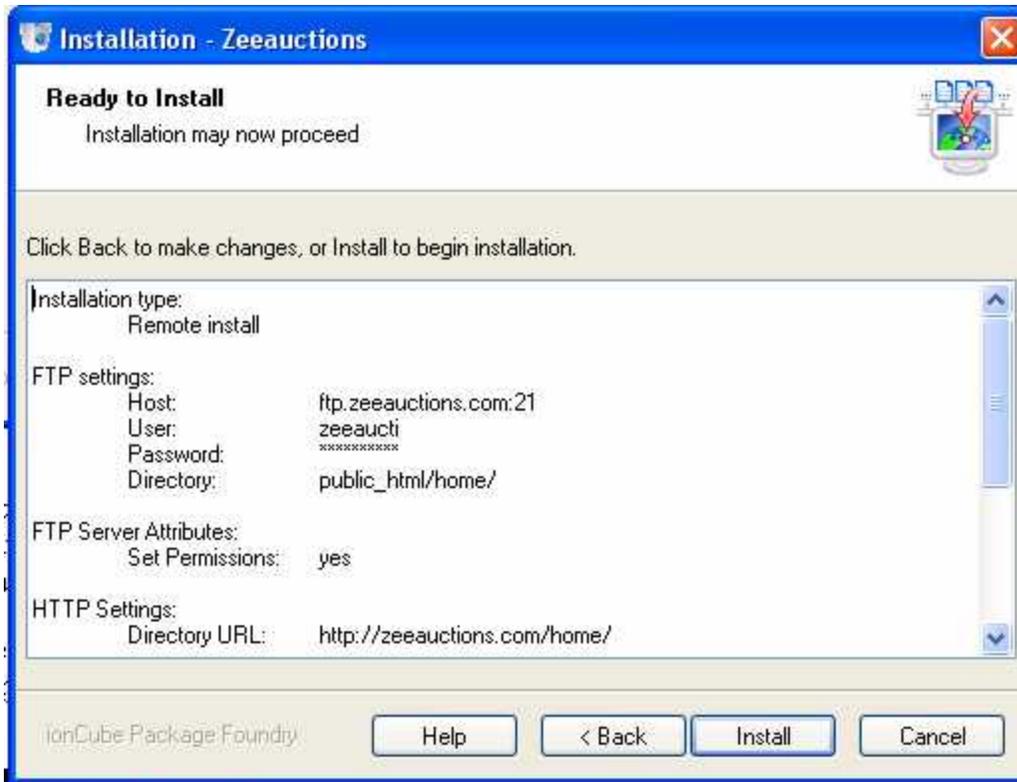

If you want to install script to subfolder, you can use already existing folder or click 'Make new folder' and then select it. E.g. it can be 'store' folder. So your Upload folder will be *public\_html/store* or *htdocs/store*

Installation location URL will be the same only with your site address. If you install script on local machine enter *http://localhost/storedirectory*

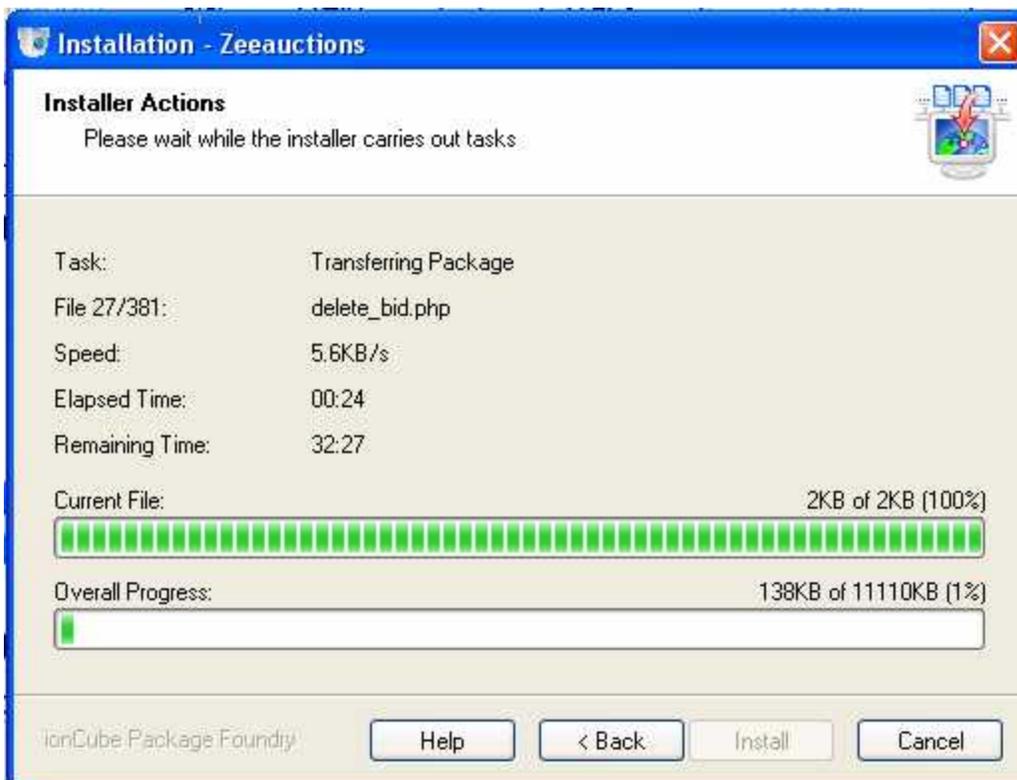

On the next wizard screen you'll see your server configuration, PHP version and install location.

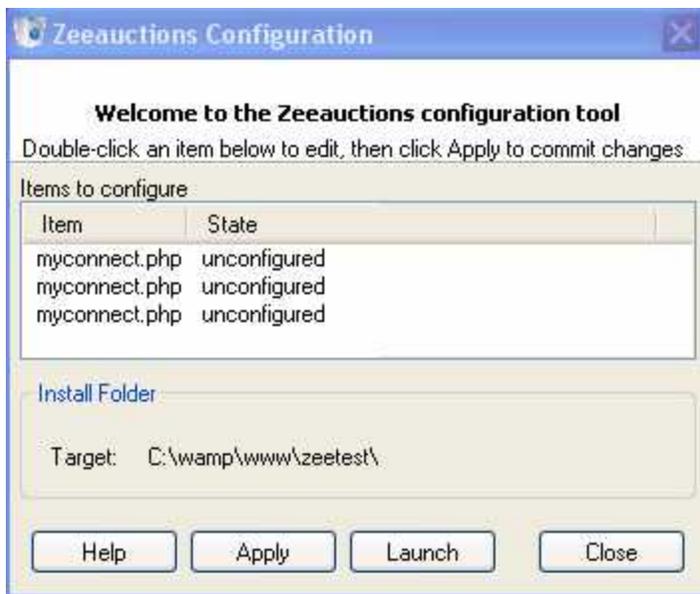

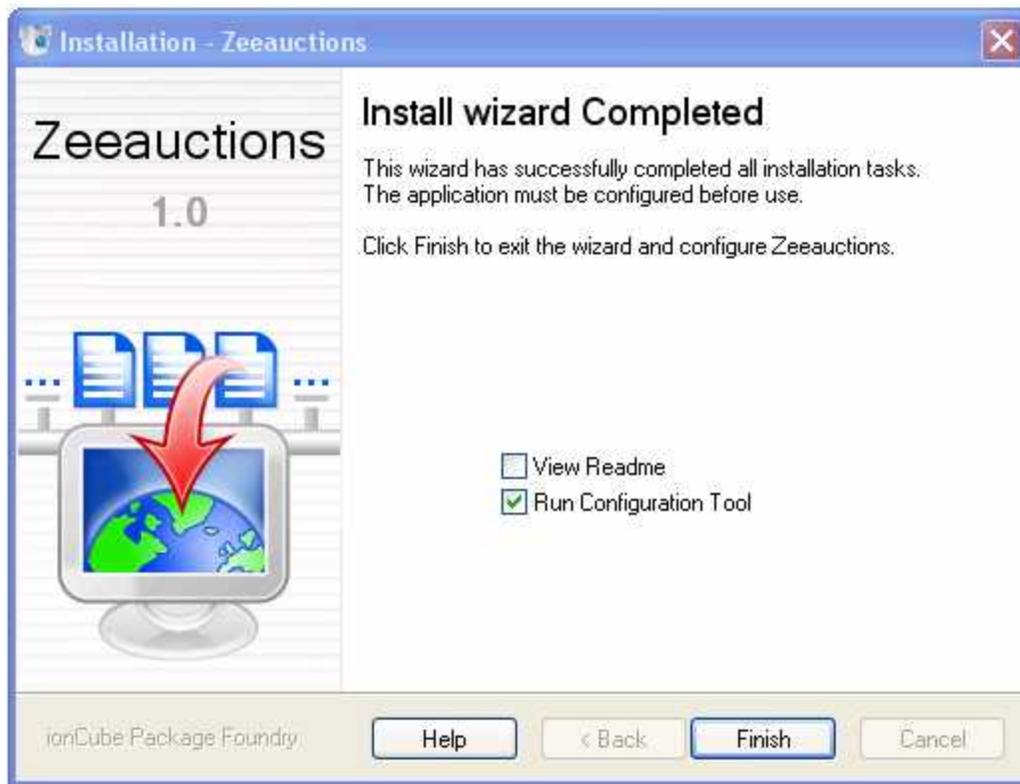

You can use Back button to change it.

After this step upload will start. It can take several minutes to complete depending of you connection speed.

Next and very important step is running Configuration tool, it will install store database and configure connection to it.  
Click finish after upload and then run Configuration tool by double clicking on configuration file name.

Simple text editor will be opened and you'll need to enter your MySQL info.

```
//CONFIGURATION SECTION STARTS ///
```

```
$servername='localhost' ; // Replace this 'localhost' with your server name
```

```
$database_username='db_username'; // Replace this with your username
```

```
$database_password='db_pass'; // Replace this with your password
```

```
$database_name='db_name';// 'bidmonster'; // Replace this 'db' with your database name
```

```
// CONFIGURATION SECTION ENDS ////
```

Enter the Database Details for all Unconfigured Files and Click Ok and then click Apply button.

**YOU ARE DONE !**

Login to /Admin section and Configure your website.

Default username admin  
Password admin

From this admin area you can configure various site options

After this your website should run perfectly.

If you need any assistance of any kind, please feel free to ask.  
We charge USD 15 for each script installation.

We are always here to assist you.

Thanks a lot,  
Kind Regards,
